

LALRISE START SC

APPLICATION DIRECTIONS

Mixing Rate:

- Use 7.5–15 mL of LALRISE START SC per 40 litres of clean, chlorine-free water.

Mixing Instructions:

1. Add LALRISE START SC gradually to water while stirring or agitating.
2. Continue mixing until a uniform suspension is formed. Keep solution agitated during use or remix before each application.
3. Use the suspension immediately. Do not store for more than one day.

Application to Plants:

- Dip bare rootstock into the prepared suspension.
- Ensure full coverage of all root surfaces.

Note: Ensure that as much packing material (e.g. sawdust) is removed from bare rooted plants before dipping into slurry.

Replacement of Suspension:

- Discard and replace the dip solution after treating approximately 1,000 plants per litre of suspension, or sooner if the solution becomes visibly dirty, or large plants are being dipped [which increases the load per plant].
